

Talend Code Extract Process

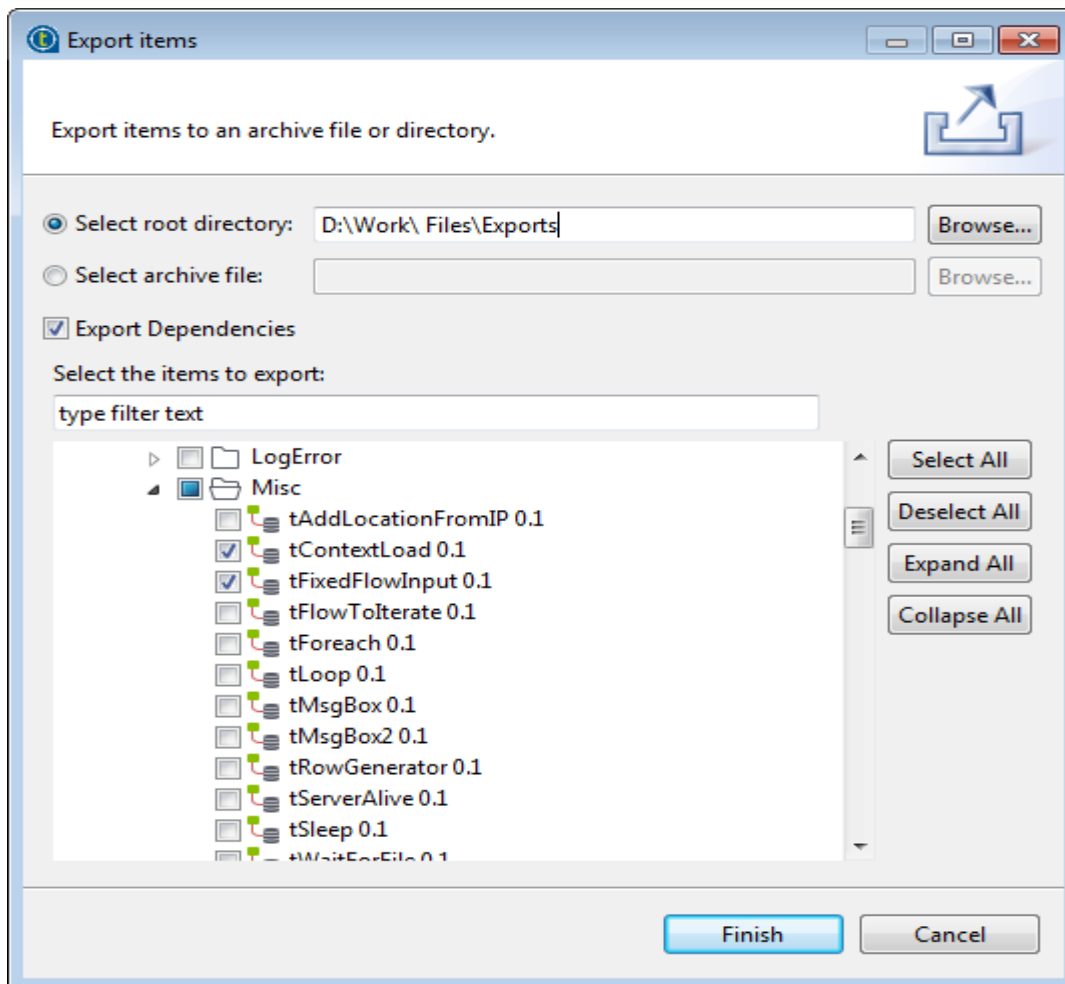

Exporting Talend Jobs

1. **Open Talend Studio:** Launch Talend Studio and navigate to the **Integration** perspective.
2. **Select the Job:** In the **Repository** tree view, expand the **Job Designs** node to locate the job you want to export.
3. Right-click on the job name and select **Build Job** (or **Export Job** in older versions). To select several items at a time, press the **Ctrl** key and select the relevant items

Information note Warning: If you want to export a database table metadata entry, make sure you select the whole DB connection, and not only the relevant table as this will prevent the export process to complete correctly.

4. Right-click while maintaining the **Ctrl** key down and select **Export items** on the pop-up menu:

You can select additional items on the tree for exportation if required.

5. Click **Browse** to browse to where you want to store the exported items. Alternatively, define the archive file where to compress the files for all selected items.

Information note

Note: If you have several versions of the same item, they will all be exported.

6. Select the **Export Dependencies** check box if you want to set and export dependencies along with the items you are exporting.

By default, all the user routines are selected.

7. Click **Finish** to close the dialog box and export the items.
